Hamleys India Footer Module Automation

Easy English speaking script - designed for a 5 to 7 minute SME presentation

Slide 1 - Opening

Speaking time: 15 seconds

Good morning, sir. My name is Aditya Nimbolkar.

Today I will present my individual automation project on the Hamleys India website.

My work focused on automating the complete Footer module using both Hybrid and BDD frameworks.

Slide 2 - Project Title

Speaking time: 20 seconds

The title of my project is Hamleys India Footer Module Automation.

I developed the automation using Playwright and TypeScript.

The same footer journeys were automated using both Hybrid and BDD frameworks.

Slide 3 - Contents

Speaking time: 15 seconds

In this presentation, I will explain the application overview, modules covered, functional test coverage, framework architecture, defect identified, utilities used, and finally the project summary.

Slide 4 - Application Overview

Speaking time: 40 seconds

Hamleys India is an e-commerce platform for toys and gifts. Customers can explore products by category, brand, character and age group.

My individual responsibility was the complete Footer module. The footer contains category and brand links, support pages, policy pages, newsletter, store locations and social-media links.

I automated these footer journeys using Playwright and TypeScript in both frameworks. My main testing focus was functional and regression testing.

Slide 5 - Modules Covered

Speaking time: 40 seconds

I divided my work into two major modules.

The first module is Footer Navigation and Shopping Links. It covers categories, brands, search, filters, sorting, product details, wishlist and cart journeys.

The second module is Footer Support, Policy and Social Services. It covers Track Order, Customer Care, Store Locator, Newsletter, policy pages, pincode validation and social-media links.

Every test starts from the footer and validates the journey opened by that link.

Slide 6 - Navigation and Shopping Links

Speaking time: 45 seconds

In this module, I tested shopping-related footer links.

I validated Most Loved Categories such as Toys and Games, Books, Gadgets and Sports. I also checked Most Searched links such as Lego, Nerf, Hot Wheels and Paw Patrol.

After opening each page, I checked the URL and heading. I also tested filters, sorting, product details, Add to Bag, wishlist and cart functionality.

This is important because customers use footer links to reach popular categories and brands quickly.

Slide 7 - Support, Policy and Social Services

Speaking time: 45 seconds

In this module, I tested support and information-related footer links.

This includes Track Order, My Account, Customer Care and login-related journeys. I also validated Privacy, Terms and Conditions, Delivery, Refund and Payment pages.

Additionally, I tested newsletter email validation, store search, pincode validation and social-media links. I also checked the footer at a mobile width of 375 pixels.

Slide 8 - Functional Test Cases

Speaking time: 30 seconds

This slide summarizes my functional test coverage.

I covered category navigation, filters, sorting, brand pages, product details, wishlist and cart. I also covered login, OTP, Customer Care, policy pages, newsletter validation and social-media links.

For execution evidence, I used logs, screenshots and HTML reports.

Slide 9 - Hybrid Framework Architecture

Speaking time: 50 seconds

This slide shows the Hybrid framework architecture.

Execution starts from the Playwright test file. The test file calls methods from reusable Page Object classes. The page classes contain browser actions and validations.

Locators are maintained separately, while utilities handle configuration, logging, screenshots, test data and reporting.

The simple execution flow is:

Test File -> Page Class -> Browser Action -> Validation -> Report

This framework combines Page Object Model, reusable utilities and data-driven testing.

Slide 10 - BDD Framework Architecture

Speaking time: 50 seconds

This slide shows the BDD framework architecture.

Execution starts from a Feature File written using Given, When and Then. Step Definitions connect those readable steps with TypeScript automation code.

The Step Definition calls the Page Object method. The Page Object performs the browser action and validation. Hooks support common setup and cleanup activities.

The simple execution flow is:

Feature File -> Step Definition -> Page Object -> Validation -> Report

BDD makes the test scenarios easier for both technical and non-technical people to understand.

Slide 11 - Defect Identified

Speaking time: 50 seconds

During testing, I identified a brand-page mapping and product-data defect.

When I opened the Hamleys brand page, I expected the Hamleys heading and Hamleys products. However, the heading displayed Beados - 7 products, and the page showed unrelated brands.

One product card also displayed the numeric code 491213292 instead of a proper product name.

The impact is customer confusion, incorrect brand browsing and reduced trust.

Slide 12 - Utilities and Script Design

Speaking time: 60 seconds

In this project, I used Playwright, TypeScript, Node.js and Cucumber.js.

The Hybrid framework uses Page Object Model and data-driven testing. The BDD framework uses Feature Files, Step Definitions, CustomWorld and tags.

ConfigReader manages configuration values. ExcelReader and CSVReader read test data. Logger records execution details. ScreenshotUtil captures screenshots. RunReport supports reporting, and Keywords contains reusable actions.

Each footer scenario has its own test file or feature file, while reusable page classes reduce duplicate code.

Condition-based waits and scroll or click fallbacks help handle slow loading and sticky elements. Logs, screenshots and HTML reports provide execution evidence.

Slide 13 - Thank You

Speaking time: 15 seconds

To conclude, I automated the complete Footer module of the Hamleys India website using both Hybrid and BDD frameworks.

This project helped me understand Playwright, TypeScript, framework design, reusable automation and defect identification.

Thank you, sir. I am ready for your questions.

Quick Revision Before Presentation

Hybrid flow: Test File -> Page Object -> Utility -> Browser -> Validation -> Report

BDD flow: Feature File -> Step Definition -> Page Object -> Browser -> Validation -> Report

Defect: Expected Hamleys heading and products, but the page showed Beados and unrelated products.

Project summary: I automated the complete Hamleys India Footer module using Playwright, TypeScript, Hybrid and BDD frameworks, covering navigation, shopping, support, policies and social-media journeys.

Presentation tip: Speak slowly, look at the SME after every two or three lines, and explain the architecture diagrams from left to right.
